handbook of ultraviolet and pdf

Ultraviolet (UV) is electromagnetic radiation with a wavelength from 10 nm to 400 nm, shorter than that of visible light but longer than X-rays. UV radiation is present in sunlight constituting about 10% of the total light output of the Sun. It is also produced by electric arcs and specialized lights, such as mercury-vapor lamps, tanning lamps, and black lights.

Sodium Hypochlorite Handbook

Ultraviolet germicidal irradiation (UVGI) is a disinfection method that uses short-wavelength ultraviolet (UV-C) light to kill or inactivate microorganisms by destroying nucleic acids and disrupting their DNA, leaving them unable to perform vital cellular functions. UVGI is used in a variety of applications, such as food, air, and water purification.. UV-C light is weak at the Earth's surface ...

L Object = Luminance of the object. L Background = Luminance of the background. If we use the luminance values shown in the upper portion of the figure we can calculate that the lower portion of the cylinder, where

the roadway is the background, has a contrast of $(1-22)/22 = -0.95$, with the negative value denoting that it is negative contrast.

Le rayonnement ultraviolet (UV), également appelé « lumière noire » parce qu'il n'est pas visible à l'œil nu, est un rayonnement électromagnétique d'une longueur d'onde plus courte que celle de la lumière visible, mais plus longue que celle des rayons X. Il ne peut être observé qu'indirectement, soit par fluorescence, soit à l'aide de détecteurs spécialisés.
