Plate tectonics (from the Late Latin tectonicus, from the Greek: *τέκτων*, *tékton*, "pertaining to building") is a scientific theory describing the large-scale motion of seven large plates and the movements of a larger number of smaller plates of the Earth's lithosphere, since tectonic processes began on Earth between 3 and 3.5 billion years ago. The model builds on the concept of continental ...

Continental drift is the theory that the Earth's continents have moved over geologic time relative to each other, thus appearing to have "drifted" across the ocean bed. The speculation that continents might have 'drifted' was first put forward by Abraham Ortelius in 1596. The concept was independently and more fully developed by Alfred Wegener in 1912, but his theory was rejected by many for ...

Plate tectonics is the theory that explains the global distribution of geological phenomena. Principally it refers to the movement and interaction of the earth's lithosphere.

Plate Tectonic Theory - The British Geographer

Plate tectonics is a theory of geology. It explains movement of the Earth's lithosphere which is the earth's crust and the upper part of mantle. The lithosphere is divided into several plate, some of which are very big

and can be entire continents.. Dissipation of heat from the mantle is the original source of energy driving plate tectonics. Exactly how this works is still a matter of debate.
